Yes, the lack of reverse lookup zone caused:

DNS request timed out ****can't
find server name for address 192XXX

The other problem is fixed by ensuring the zone accepts dynamic updates and the DC is pointing to it and configured to register in DNS – the NETLOGON process will re-register SRV records every hour, and the A and PTR RRs every 12 hours.

Sorry for the delay – I've been on an extended holiday ;-)
