You need to modify the security privilege called "Log on locally". It can be found under Computer Configuration\Windows Settings\Security Settings\Local policies\user rights assignment.

By default, a lot of accounts are granted this privilege, e.g. "Administrator", Power Users, Users and so on, depending on your current configuration. Basically, you need to modify it allowing only Administrators and your user account to log on locally, removing all other entries from the list. But you might need to keep some groups or accounts depending on your security model.

Then just apply this GPO so it affects all computer accounts where only this user should be able to log in.
