In news:01E4B70B-CDF2-43CE-9D03-105ED2D29BF7@xxxxxxxxxxxx,
drl <drl@xxxxxxxxxxxxxxxxxxxxxxxxxxxx> made this post, which I then commented
about below:

> I have two workstations that keep losing their computer account in the
> domain. When this happens, nobody (including domain admin account)
> can log into the computer. So I log in as local computer admin and
> rejoin the domain. It tells me that an account for the computer was
> already found and would I like to use that? I say yes and reboot and
> it works fine again. But lately one computer in particular is doing
> this every couple of days. I believe it is a Windows XP client. Any
> ideas as to why this is happening?

This may be due, among many other things, such as time skews, to a DNS
misconfiguration. We'll need specifics about your config. Let's start off
with providing us an ipconfig /all of a DC and of a client machine please.
This will give us a specific picture of your AD DC/client configuration and
will give us a good start for a diagnosis.
