The referral should work, but if the user/password that is presented to ADAM isn't an ADAM user or a Windows user that is configured to work in ADAM, they won't authenticate.

Actually after reading up on ADAM, maybe I can explain this better.

Can I create an LDAP Referral in EDirectory that will point to ADAM and ADAM will authenticate the user and password that was presented in the Portal App?

"Joe Richards [MVP]" wrote:

I do not believe you can proxy auth this way. ADAM only uses internal secprins or Windows secprins. You would need to sync edir principals into ADAM with something like MIIS.

Re: EDirectory To Adam

HI. Any ideas or docs on the best way to perform userproxy and authentication of users logging in to an EDirectory aware app. I want to have the EDirectory proxy the Authentication to ADAM. I have been told that the App is only EDirectory aware and cant Authenticate users directly against it.....Thanks
