you can use the UPN (implicit or explicit) or you can use the NT style logon by entering <domain>\<user> in the username field. For the latter you may need to first install a hotfix.

Look at:

<http://www.microsoft.com/technet/prodtechnol/windowsserver2003/technologies/directory/activedirectory/fedffin2.ms>  
search for (without the quotes) "User Experience Changes in Moving to Forest Trusts from External Trusts"

start reading from there.

I'm looking into Active Directory forest trust, but stumbled into a problem. The setup is two forests (2003 native mode); one of the forests contains two domains, root domain A and child domain B. The second forest contains only one domain (domain C). I've created a one-way forest trust between domain A and domain C, outgoing trust from domain C.

Re: Forest trust child domain not visible in logon dialog box

I'm logging onto servers/clients in domain C, using a user account from domain B. However, the logon dialog box do not display the child domain B only the root domain A. I have no problem logging on by using the user logon name, but I would like to actually see the domain in the domain list. Is it supposed to work this way?

Thanks!

/Ragnar
