I know of know way to verbosely detail what is happening at logon, if there is a way then I would like to know as well.

You can run ntdiag between your client and the dc to see issues. This can be set to verbose.

I have a gui script set up for this at:

<http://www.pbbergs.com> select downloads

NetDiag:

RE: Slow Log on to 2003 domain, xp clients + 2000 TS – NOT DNS pro

Hi.

I have no ISP dns defined on client pc's through dhcp, or on static ip on server. I dont think its an dns problem, but more related to folder redirection not working 100%. But i need tools to check users profiles, or what happens when they log on. How do i enable Verbose logging?

"Paul Bergson" wrote:

Do you have only AD DNS servers defined on your clients?
No isp dns defined.

Hi.

Got a 2003 DC running AD, DNS, WINS + DHCP. Have 1 windows 2000 terminal server, 1 windows xp pro + 15++ windows 2000 machines. All are fully updated + running vrus programs. I've enabled folder redirection. Got some error when a user enabled synchronizing on the folders redirecting (His admin rights are suspended :-() , but got that solved. But im stuck with LONG log on times on Windows XP machine, windows 2000 terminal server + directly on the DC (Using administrator). Something is obviously wrong, and would love some tips checking where the problem is. How do i enable verbose reporting on USERENV? Regular windows 2000 machines has no problems. Since all profiles cataloge was affected, is there a way to check over profiles or "reset" them? Checked over DNS server, and im 100% sure its not a dns problem. I get NO error messages in Eventviewer regarding folder redirection, permissions, dns or anything.

With regards
Erling Herstad
