Hi

the problem with Access_Sys_Sec is what I was trying to explain with regard to SACL. Are you saying that:

with the Windows account in the configuration Admin role if you request a security descriptor with the SACL box unchecked you do not get the DACL in the security editor UI?

Thanks
Lee Flight

As to your questions below, I am using LDP to access the security descriptors, and even though the ADAM service account has been added to the Administrators group in the configuration partition, I still see audit failures relating to Read_Control and Access_Sys_Sec in the security log.
