OIC. What the policies apply to depends on what policy was modified and what it was linked to as well as whether or not there is a competing policy.

Obviously something changed, kind of hard to guess what it could be from the outside.

Hi Paul / Joe,

Don't get confuse i will explain clearly with some example. Thing i have TESTnamed DC and XYZ is a system is the member TEST domain.

TEST.COM --- Domain Controller
XYZ --- Member of TEST domain -->FQDN - XYZ.TEST.COM

Iam applied Administrator Account rename group policy (3 months before) for all member systems in a TEST.COM Domain, it is renamed the administrator account only in member of domain systems (i.e. XYZ.TEST.COM), but now only (after 3 months) its renaming the builtin global administrator account in the DC also.

My Question is if group policy work like this means why its not renamed the builtin global administrator account in the DC before 3 months.

Now i thing you will get my points.

Thanks Shaik

"Joe Richards [MVP]" wrote:

Yes there appears to be confusion here on several levels. :)

As Paul indicates Shaik, there is one builtin administrator account in the domain that exists on domain controllers.

There is no local admin account on a DC, only the global admin account. So confused on what you are confused on.
