The user name and password aren't entered in the service logon, which is set to the local system account, but within the application. The error reported in the event log in an 1816 error.

The users were set up about 12 months ago with no password expiration and the passwords have never changed since they were created, furthermore if the server is rebooted then they start up and continue to work for a few days with no problems. In fact I only see the error as the database package is closed down each night to allow the backup and then the restart fails.

Hi

After running for a few days these packages refused to start up using the username credentials that had worked previously.

Did you change the password of these users' accounts? Does

Re: Help with a member server loosing the ability to validate users

the account have password expiration limit?

In an attempt to resolve this I have transferred all 5 FMSO roles to a new server along with the DNS server role. However I am still experiencing the same problem

In all cases rebooting the machine, which is now a member server, resolves the issue

event log errors?

I have a machine that used to hold all 5 FMSO roles and was both a DNS server and DHCP server, along with an email package and database package. The latter 2 ran as a service with dedicated username specifically set up to run the service.

After running for a few days these packages refused to start up using the username credentials that had worked previously.

In an attempt to resolve this I have transferred all 5 FMSO roles to a new server along with the DNS server role. However I am still experiencing the same problem

In all cases rebooting the machine, which is now a member server, resolves the issue

Does anyone have any ideas were I should
