True I was always a fan of adding them to local admin group and removing once software was installed. but sinice xp upgrade I have tried to add the user to the local admin group but I seem to be unable. It gives me an option to add users from the local system i.e. laptop-xp and does not let me add users from active directory. I am lost here all help is welcomed.

Regards

I have contacted the company that supplies it and they say you need to give the user admin rights. I then edited her account from the server using active directory to make her an administrator and domain admin.

– What???!!!, you need to be Domain Admin to install software on a laptop??

– Don't make your users members of Domain Admins or you can be very sorry later.

– Making the user member of LOCAL ADMINISTRATORS on the laptop should be MORE THAN enough, or use the runas command to install the app on profile's users.

I then edited her account from the server using active directory to make her an administrator and domain admin. I then try to install the program using that account and it still says that the users has no install rights.

Don't do this, if your vendor is pushing you to do this, take my advice, and buy a new App.

I logon as domain admin to the laptop that I want to install the software on. This laptop is a member of the domain. I then install the program it works fine when logged on as administrator but when I login as the user that will use the software in this case a restricted user that does not have install rights it does not work. I have contacted the company that supplies it and they say you need to give the user admin rights. I then edited her account from the server using active directory to make her an administrator and domain admin. I then try to install the program using that account and it still says that the users has no install rights.

Hope that made sense.

I run SBS 2003 as PDC,
AD, Exchange, DHCP, Print
server etc...

Client is running xp pro and
logged on to the domain.

I am trying to install an
accounts package but it
seems that you
need
to
be
an administrator for it too
work! Im sure you all heard
of this one
before
but here we go again. I have
already added the user to
domain admin
and
administrator group and still
they cannot add/remove
programs.
Please
help.

Regards
