Thanks. I will try this.

Do I have to run it on the server itself, or can I do it from a computer attached to the domain?

Next question – is there a similar script to create home directories for users already in Active Directory, and assign them rights?

Is there a way to create a new user along with home directory (and rights to it)?

Ideally I would like to be able to import a list of new users from a list that I have. There are several.

Hi,

I have an example VBScript program that creates users from the information in an Excel spreadsheet linked here:

<http://www.rlmuellet.net/CreateUsers.htm>

The script assigns values for home directory, creates the home directory folder if it does not exist, and assigns permissions. You may be able to use this.
