Hello there,

i have depoyed the following scenario in my environment.

- I created a Group Policy Object with GPMC SP1 on my W2k3 Server (DC)
- Also i supplied this GPO with a Security Filter so that the settings just have affect to a specific Group. (Group Type: Security Group - Global)
- In this Policy, there are just user settings configured.
- I linked this GOP on the top level in my Active Directory domain, because i have multiple users in different OU's wich belong to the Group, wich is definded in the "Scope-Setting" in the Group Policy object. The domain administrator does not belong to this group.

As i run the Group Policy result Wizard, a few days later, on a certain

Re: Security Filtering does not work correctly in GPO

machine, where the domain admin was logged on, i found in the result set, that GPO with the Security Scope on the specific group, has applied on the administrator!

How could this happen. I am a little bit helpless now, because of my logical understanding. The domain admin shouldn't receive this settings. Normally it should only take effect on the adjusted group in the Security Filtering box.

thanks for your help  
Roland
