Thanks Jorge.

I don't think i figured everything out. I still can't ping the server from any workstation in the same subnet.

any workstation outside the subnet, and server, can resolve this box.

The problem is, the traffic may not be relegated to just icmp.

a Dell software enginner mentioned it could be a group policy oobject that was upgraded from win2k that possibly applies to the "main office" and enabled the Windows ICF or IPSEC

thoughts on what to do ?

run gpinventory and gpmmc reports to verify ?

Jorge Silva wrote:

well glad that you've everything working. As for the TCPIP you should post that in ngp at Security or Networking, there you can have a better answer.
