Do you have the rights to amend that account? (Right Click, Properties, Security)?

I've got a strange issue. I have an account that is being used as a network service account. Because it's a service account, I don't want anyone or any program accidentally changing the password so I selected the option of "User cannot change password". However, once I check and apply it, if I go back into the account properties later, the option is no longer checked.

There are no group policies that I can find that would affect this. Is there any other reason why this option might mysteriously uncheck itself?

Thanks.

Jason
