Hi Paul.
That is ofcourse the way to do it.
I totally forgot about that one.
Thanks a lot.

regards
Patrik

You could use the restricted user group gpo setting

computer configuration \ windows settings \ restricted groups

group = your group to be made local admins
member of = BUILTIN\Administrators

<http://www.windowsecurity.com/articles/Using-Restricted-Groups.html>

<http://www.microsoft.com/technet/prodtechnol/windowsserver2003/library/TechRef/156780ef-eb36-4433-b2>

http://www.microsoft.com/resources/documentation/windows/xp/all/proddocs/en-us/sag_scerestrictgroups.ms

There is absolutely nothing that has to be done on the client side.

Create the gpo in the ou where the Computers reside (NOT the users), go to computer configuration/windows settings/security settings/restricted groups, right click on restricted groups and select new group (For the local computers, this group name should be – administrators) and key in the group you want auto populated. Select add on the Members of this group and then add the members you want populated.

Hi

In my loginscript, that I execute via GPO, I have code that adds a certain domain group (admin group) to the local administrators group of the underlying computer.

Now I have come to realize that, unless the user who is loggin on to the machine is a member of the local administrators group him/herself, this does

not work.

Hence, it appears that the login script is executed with the same permissions as the user logging in!?

I was under the impressions that all GPO's ran with top admin credentials. If this is not the case, how do I make the script run with admin credetials ?

Thanks
Patrik
