Hi

Sounds like you have your DFL at 2000 mixed, please check that.

How do i check the integrity of our Active Directory on W2k3 Enterprise?

We have a single DC running with about 500+ users.

There are very strange things going on. For example: I have a group called Executive Team (Domain Global). When I try to add this group to another Domain Global Group, it can't find it.

When i go into my Executive Team group (domain global), click on Member Of, and try to add the name of the other Domain Global group, it can't find that group.

Yet when I right click on the root of the forest and hit 'find' and type in the name of any of the Domain Global Groups, it finds them.

So how do I check that A/D is ok, that the security descriptors are Ok.

By OK, I mean, how do i troubleshoot that my A/D has a high-level of integrity?
