Yes, I covered that much in my original post. Where to go from here is my problem, what tools would be best to determine what's going on?

Yes administrator user works just fine. So I know the link, app, etc. is valid. Just with 2500 workstations this fix wouldn't be feasible.

Hi

if you login as administrator can you install that Active X?

Re: Permissions / GPO

I've locked our desktop environment down pretty tight via GPO's. I now have a problem with some applications that we have deployed that require ActiveX components to be installed for the app to work correctly. The app servers and IIS servers are all internal. I've added them to the Trusted Sites (and would assume they would be local sites already) lowered the security Level to LOW and the ActiveX components still won't install for the end users.

I'm wondering if I've locked them down so tight that they can't install the app because they don't have enough local rights still. Lower left of the IE windows has the yellow exclamation mark, double click and it says, "Error: Access is denied, Line 10, char 2". So I think it is permissions related.

Anyone have a clue where to start troubleshooting this? If I make the user a local admin, of course it works just fine, but this is not acceptable. I've tried pre-installing the component via SMS but that has other issues not to mention regular updates. Is there a tool to run other than REGMON and FILEMON to narrow this down? I've gone through the GPO's and don't see anything obvious.

Thanks,
