The Power Users group isn't a domain user group; it's on the local machines. You'd need to change what you're looking in to be the local PC, not the domain.

Thank for the quick response however I should have mentioned that I did that and still no power users group?

Any other ideas?

I'm trying to apply article 888046 (Allow power users the right to

load and

unload device drivers on a domain)

When I go to add the power users group it doesn't resolve it ??? I

looked

Re: Where did Power Users go?

in the built in accounts folder and it is not there. ???

Any ideas?

=====

I ran into this same thing one day.

It turned out to be simple: When I went to select users or groups, at the top under "Select this object type" only "Users or Built-in security principals" is selected by default.

Click the Object Types button next to that, and check the Groups box.

Click OK, and now when you type Power Users it will resolve.

However

The Power Users group is a local machine group, not a domain group.
