1) Go to Active Directory Users and Computers, click View and Advanced Features. Go to OU, right click, select Properties, you will see Security tab and user account with special permissions. This entry was added with help of Delegation Of Control Wizard. I would suggest that you delegate to groups rather than to users.

Found it! So if I want to remove some rights I have delegated I'll do it from here?

Yes.

2) Create custom task with wizard, select Computer and Printer Object from list and click check boxes that allow creation or deletion of these objects.

Did it and it works

3) Maybe objects were not replicated yet? Was console refreshed?

Yes it was a replication problem, Now I can see all computers

Re: Delegate control questions

4) Which objects and why would you remove read permission?

Just a question. Have created a new mmc with only the Branch OU but have noticed that if the local admin creates an own mmc with ADUC snap he will see the whole AD but have only rights to do something in his OU

You can create custom Taskpad view for your administrators but they will be able to see entire domain if they use ADUC. Their actions are limited to OU.

Thanks
Tomppa

Hi

Have created an OU for our branch office. Have delegated control to the local admin, so he can create users and groups, reset passwords, add computers to domain.

Some problems...

- 1) Where and how can I see what rights I have delegated to him?
- 2) He cannot create computer or printer objects. What do I have to do to give him these rights
- 3) If DomainAdmin create computers in the branch OU the local admin does not see them (maybe the answer to 2 is also the solution to 3)
- 4) I suppose I cannot remove read rights for other objects in the AD?

Tomppa
