These Errors Can have Some different Causes: Generally, these errors can be safely ignored. These errors occur because the DNS server doesn't have a Reverse Lookup Zone Configured. Although Active Directory doesn't need Reverse Lookup Zone to function, the Windows 2003 and XP tries to make a secure PTR registration, and because the Reverse Lookup Zone isn't configured, the OS tries to make a secure PTR registration at the External DNS that is Authoritative over the reverse lookup of the IP on the machine's local interface. If it's a private address it will say cannot establish a secured connection with the server prisoner.iana.org.

Also, nslookup will report "Can't find server name for address <IPAddressOfDNSServer>
You can Create a Reverse Lookup Zone.

or

Disable Reverse Lookup Zone Registration

-Start Registry Editor (Regedt32.exe).

-Locate the following registry key:

-HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

*On the Edit menu, click Add Value, and then add the following registry value:

Value Name: DisableReverseAddressRegistrations

Data Type: REG_DWORD

Value: 1

As described here:

DNS request for prisoner.iana.org

I don't have any specific folder redirection based errors or warnings, I have plenty of LsaSrv warnings Event ID 40961, its below:
The Security System could not establish a secured connection with the server ldap/dc.company.local/company.local@xxxxxxxxxxxxxxxx No authentication protocol was available.

I don't know if it will throw any errors to begin with because it seems like "My Docs" path is hard coded in the OS and can't even change it, but I'm sure we can change it in the registry. I think if nothing works out I'll manually change in the registry and run the same script on all machines to change the path. Is there any KB on how to change folder redirection path?

Hi

Do you get any error on these machines after logn, also check eventvwr.
