You can grant Sharing permissions to certain group/user just you do with NTFS. No need to grant change to everyone.

Check to make sure the everyone group has the "change" share permission.
Share permissions not NTFS permissions.

I have a 2003 domain. For the last week I have been having a problem with network shares. I create a shared directory and put some word, excel, etc files in that directory. i then grant full control to certain users who are members of the domain users group. When they map that share and open a file it will open as a read only file. If I add that same user to the domain admins group they are able to open the files with full permissions.
