The lostandfound class is a specific class defined by Microsoft for Microsoft. What do you think you get by creating your own container of that class versus a container class?

I could understand if it was not possible to do it on the standard LostAndFound container – but if you yourself create a new container of the type lostand found – then I would have expected it to be possible.

Re: Applying Audit to container of type LostAndFound

Is it possible to apply Audit settings on a container of type LostAndFound.

Trying to do this causes a message box saying "The server is unwilling to do."

The error message only shows up if trying to apply the Audit setting directly on the Container. If applying it on the parent container it Inherits the settings perfectly!

Is this by design or?

TIA
