the original poster states:

"only add a certain set of computers as members to a set of groups"

this is not possible!

why?

if you are delegated the right to manage group membership, you are delegated the right to make EVERY SECURITY PRINCIPAL (users,groups,computers) a member of that group

i do like this :
place the main application group in other OU,
create a application group in each OU so the administrators can add the

Re: Delegation of groups admin. – restricted to a subset of objects

computers to that group, and add this applications groups to the main application group.

We have delegated administration of computer objects (workstations) for specific OUs. So if you are a workstation admin in one OU you can only manage the workstations in this OU and not other OUs (Full control).

We are now creating application groups where workstations are to be members. The application groups are common for all in the domain.

We want to delegate administration of the application groups (to add/remove members of the application group) to the workstation admins. We can create a separate delegated group for this. But the delegated administrator of the application group should only be able to add and remove workstations which are within the OU where he has delegated rights, not other workstations in the domain. Workstations within an OU are in addition member of separate groups.

Is this possible within AD or do we need a web solution? Any suggestions?

Thanks

Gaute
