hi,

OU1 = workstations+group1->member of groupmaster;delegated admin1 have full rights

OU2=wokstations+group2->member of groupmaster;delegated admin2 have full rights

OUmaster= groupmaster;admin1+admin2 dosent have rights here;

i dont want to argue with you but the this is the fact what i see:

he dont want to add "a certain set of computers" it's want to add only the workstation on that OU.

"if you are delegated the right to manage group membership, you are delegated the right to make EVERY SECURITY PRINCIPAL (users,groups,computers) a member of that group" only if i have the rights to change the group memberof of that security principal – and in the case of that i don't have rights on others OU so i cant add in my group the other workstation from the others OU's and if in my ou i have delegate only to computers to write memeberof i can add only workstations from that ou (in most cases is sufficient to deny write memeberof on users object).

why? for shure is not a direct metod, but in fact the administrators of  
that  
OU will can add on that group only the computers that he manage and not  
the  
others.

That doesn't actually solve the problem the OP has.

i do like this :  
place the main application group in other  
OU,  
create a application group in each OU so the  
administrators can add the  
computers to that group, and add this  
applications groups to the main  
application group.
