Hello, I'm in the process of building an application where help desk personnel will be able to query AD for a users employee id in order to verify account modification request. I do not need for them to be able to see the entire id only the last five digits. I know i can do it within the app but the problem i have is if they were to use vbscript or Dsquery on there local machines to query ldap then they would be able to see the entire id. I would like to know if there is a way to mask an attribute in AD so that when non administrators query AD it only returns n number of digits. Any insight will be appreciated

.
