By default you shouldn't have to do anything. The members of the domain are smart enough to get their time from the dc's and the dc's know to get their time from the PDCe. Just verify that you time one settings are correct.

Why are you saying that the machines can't get the correct time? Do you have any errors or is a clock on one of the member machines off, etc... More info could help assist you.

Hi Jorge and Paul,

Thank you for everything. Now I can resolve the problem. But I have to stop the time service in all service except the server that has a PDCe rol. Do you know if the correct form.

If not the computers and the other servers got the time for the rest of servers.

I don't know anything way to do this; If there are some better solution you can tell me please.

Thank you for everything.

You should be using w32tm

Here is a brief link on XP connections for work groups or domains.

In my business have different servers with windows 2000  
Server and 2003  
server. The problem is that the servers and computers cannot  
resolve  
the  
time. I read that the computer that have the time service have  
to have  
the  
PDC role Emulator. The server who now have the PDC role  
Emulator it's  
different that have the time service I think, but I don't know  
100 per  
cent.  
How can I know in what computer has the time service?

I prove to put in the script log session this: "net time \\server  
/set  
/yes", but computers not load the script logon, because  
before login  
appears  
the warning message.

Could you help me?

Thank you.
