Hi,

A lot of our users are set as local admin on their own machine. This is not something i personally like and something we want to stop.

But then we get problems that we just can't get round so end up making them local admin. For example a use some features in access 97 and also can't use some other SQL related tools.

(I realise this is not an AD question as such) but i will link to it.

Is there a better way?

Also is there anyway with a Group Policy to allow them full access to a specific program or anything.

I realise i may be clutching at straws here but so many people request admin privs and we just end up giving them because we can't find workarounds.

Any info/help/suggestions on what your business currently does greatly appreciated.

Michael.
