You want to have only a single user account, located in one of the two domains, eg DOMAIN1/USER1. Using the trust, you can grant access to resources in DOMAIN2 by adding DOMAIN1/USER1 to the ACL. Let the user logon to DOMAIN1/USER1.

NOTE: If in DOMAIN2 Global Groups are used to grant access to resources, you cannot add the user from DOMAIN1, as a global group can only contain members of the domain it is located in. You have 3 options: 1) convert the Global group into a universal group, which can hold users from both DOMAIN1 and DOMAIN2 2) convert the Global Group into a Domain Local Group, which can hold users from both DOMAIN1 and DOMAIN2 3) Add the user to the ACLs of resources in DOMAIN2 where he/she needs access to.

I am running Windows 2003 server. We have two companies here that do completely different business and use different domains. We have our domain and domain contollers and they have there's. We have one user that needs to be able to access applications from both domains. We have two nic's installed each has an IP address from each domain. If we login to the computer locally, we can access everything, but like for Outlook, she has to enter her username, passsword and domain. For the other company, has has to enter the login and password to connect to the network drive.

We tried to setup a two-way trust using eachothers domain and set up a password that we both use. We would like the computer to be able to logon to the main network that she uses but still be able to access the mapped drive to the other domain.

Re: Seperate Domain Trusts

Is this possible?

Thanks
