In general this sounds like a replication issue. If possible, move the PDC emulator role to another DC and test if that helps.

Alexander Schaefer wrote:

Hello,

in our Windows 2003 Active Directory we experience strange password change behavior: When administrator force the user to change its password on the next login (activating the appropriated check-box in the AD Users management), the user will be requested to change its password NOT as expected at the next BUT by the 2-nd login... This causes a lot of problems, because i.e. Exchange does require the new password even by the first login... This affects all users, but not the members of Built-In OU "Admins"

Analyzing the eventlog messages we find out, that by the first login there are 2 error logs in the clients application log: Event-ID 1006 and 1030, which means the workstation was unable to connect to domain controller.. and that each time by the first logon when for this user the "user must change password at next logon" was activated. And this is the same for each of our 40 locations (LANs) worldwide!

Does anybody know how to solve this problem?
