That makes more sense. As far as groups go, I'm trying to add a global security group from "domain" to the local machine Administrators group of member servers in "sub.domain" via group policy. However, the global groups from "domain" are not an available choice (via the Restricted Groups interface). I can manually do this at each machine however, so it doesn't make sense as to why, they can be added at the machine level but not from group policy.

"Al Mulnick" wrote:

By putting an entry in the "memberof" section, you're saying that it's going to be made a member of the groups defined. The group defined is the administrators group. It is kind of counterintuitive, but that's what works.

Are you trying to add a global group to a global group? Or am I mis-reading that?

Yes, the group type is a global group from "domain". And, I'm not clear how "member of" works, could you elaborate a little more? I would think member of means that the local machine administrators account would then be a member of another type of account?

Thanks,

George

Re: Restricted Groups problem

Sounds like a group type issue. I haven't tried it quite that way, but all you're really interested in is adding the group to the local administrators. Membership is not really critical to this situation.

What is the group type? Are you saying it's a global group from domain ?

As for not changing the local administrators group, you'll want to use the memberof feature only. Do not populate anything for the group.

Hi!

I'm having a problem assigning the users/groups I want to the local machine administrators groups through the Restricted Groups policy. Here's my scenario:

- "domain"
- "sub.domain"
- OU in sub.domain called web servers

I have a Global Security group in "domain" called WebServerAdmins with users from "domain".

On member servers in the web servers OU of sub.domain, I can manually add domain\webserveradmins to the local administrators group.

I add "Administrators" to the Restricted Groups of sub.domain.

Re: Restricted Groups problem

However,
when I try to add members to this group,
domain\webserveradmins is not
available from the "domain" location. The
individual members of
domain\webserveradmins are available
however.

I also created a sub.domain\test local domain
group and added the
global
domain\webserveradmins to it. However, in
Restricted Groups, the only
sub.domain groups available to choose are
sub.domain global groups such
as
sub.domain\Domain Admins.

The bottom line is that I want, via group
policy, to add
domain\webserveradmins to the local
machine administrators group of all
memberr servers of sub.domain.

In addition, I don't want to change the
existing local member server
Administrators group, just add to what's
existing.

Thanks,

George
