That means that to connect to that specific computer, the Windows XP will send those specified credentials.

Thanks but,

What does it mean "then use that account as cache credentials" ?

Regards

Alfred

"Jorge Silva" wrote:

Hi Alfred

For example, you could create a very limited AD Account that only has access

to that printer, then use that account as cache credentials in that windows

XP to access that printer.

Thanks but I use local account on this PC for security reasons and I don't want this local account access the domain resource (except for the printer)

Regards

"Andy Smith" wrote:

Hi Alfred,

You could create a Domain user who has identical credentials (username/password) as the local account on the XP machine.

They only need to be a member of the Domain Users security group

"Alfred" wrote:

Configuration :
Server = Windows 2003
Server (and printer published in AD)
Client = Windows XP

Is it possible to access to a AD published printer from a PC Client with a local account ?

Regards

Alfred
