I'm getting SO close to making this work I can't stand it.

I've gotten ADFS implemented to the point that I go to <http://servername/certsrv> and am prompted to accept two separate certificates, then a logon box appears. I type in my AD user name and password and Internet Explorer starts doing something, the word "Working..." appears in the title bar, then I get a page that says "You are not authorized to view this page".

In the ifsaplog have a failures. One in particular says webssohandleupnlogon failed for urn:federation:domain:domain\upn. It's not even possible to logon with domain/UPN is it?

I think I may have set up my URI wrong? Or my claims? I'm using a group claim and I mapped it an AD group. Am I supposed to use an identity claim?

In my event logs on the web server there is an event 104 every time I get the IE error page. Part of the message says "The cookies that were presented by the client could not be validated.

There is a light at the end of the tunnel finally, hopefully it's not a train.

Thanks for any help you can provide!
