Thanks for the reply Jorge. I'm still kind of confused though. IPsec or not, if the new DC will be a part of an existing domain with trusts to other domains, does the new DC need to be able to communicate with the other domain's domain controllers (the new DC will be configured to communicate with the other DCs in the domain that the new DC is a part of).

In other words, if I join a Windows XP computer to the same firewalled subnet as the new DC, can I login to the Windows XP computer with credentials from a trusted domain? Or will I need to enable communication from the new DC to the trusted domains on the other side of the firewall in addition to the DCs in the domain that the new DC is a part of.

My goal is to limit the number of rules to be added to the firewall for security and simplicity of administration. However, I'm willing to create whatever I need for this to work. And I'm not in a position to test this setup, yet, thus my asking in this newsgroup.

Any help is appreciated.
Tim

Hi

You can enforce IPSec for communications only between these 2 DCs.
