Hi,

thanks for this information. It is a request of a customer who hosts the ADAM at a hoster. I will give it a try and test it and maybe will get back.

Thanks and Kind Regards,
Thorsten

Hi

members of the Administrators role in the ADAM configuration naming context are Schema Admins. However the application naming context Admins are not Schema Admins so the question is do you need to distinguish config NC admins from Schema Admins? Bear in mind that if you do create a Schema Admins role who will control its membership, it would probably make sense only if membership was controlled by another group (not config NC admins) or the Schema Admins themselves. Also you will need to revoke default permissions on schema for configNC admins, should be OK but I have never run in that configuration in production.

If you think it still worth investigating then install a test ADAM instance, run ldp and bind to the instance, right-click schema NC -> Advanced -> Security descriptor and look at the ACE that is set for cn=Administrators. You want to duplicate that ACE for a domain group or ADAM role that you intend to use as ADAM Schema Admins. It's basically an access mask of everything except delete, set to inherit down the schema tree. Post back if you need more help.

Re: ADAM – Schema Admins?

Hi,

Is there a way to differ between "normal" ADAM Administrators and Administrators with Permissions to change the Schema? It would be helpful to have permissions like the Active Directory Group "Schema Administrators" and to be able to have different Administrators for normal tasks and Schema Tasks.

Any ideas? Maybe.. .settings ACL.. but which and where and how...?

Thanks and best Regards,
Thorsten
