Hi Shae

Have you look into UPN.. ??

By default UPN suffix for a user account is the domain containing the account however, UPN suffixes can also be used .

To make it simpler to log on to the network, Active Directory allows you to implement a single UPN suffix for all users.

HTH

Eric,

Is there no way that a user from singapore (child domain) can log onto our domain (parent)?

i.e if they visit our site (parent) with their laptop?

is there no such thing as a global user? that can logon to a domain that is the parent of its own domain?

If not, then maybe we should just keep it part of our domain, with a site link

"Eric Denekamp" wrote:

By the way, it would work the other way around too: move your workstation to the SG domain and try to log on with the rogerrabbit account and it should work.
With the dowmain selection you only point to the location your account is,

Re: User login between domains in the same tree/frrest

so the easy route to validation.

good luck

Eric

You always log on to the domain your account is in, so if
your account
is
in domain.local you only can log on to that domain, on the
other hand,
your MACHINE (i.e.) workstation does not have to be in the
same domain,
so
if you create an account: jessicarabbit in the SG domain, and
try to
log
on with this account, you should be able to do so.
You sit behind the workstation, select SG for domain, enter
jessicarabbit
for username and the correct password, you should be able to
log on.

good luck

Eric

Is this how it should be?

can a user from a parent domain not login to
the child domain because
he
is
not a member of that domain??

But rather he can be on a workstation that is
connected to the child
domain, and login from there to the parent
domain on which his user
account
is created?

sorry to try to answer my own question, but
is this correct?

Hi eric, thanks for the reply

tree/forrest root domain is
domain.local, child is
sg.domain.local

I created a new user on
domain.local (rogerrabbit),
and also added a
workstation to domain.local,
i called this workstation
WS1.

When i restart the WS1 and
get to logon screen, I can
select SG or
DOMAIN
from the drop down list, i
can login to the parent
domain (DOMAIN) of
which
this workstation and user are
a member of.

But if i select SG. I cannot
login!

hope this further
explanation helps, and that
you can assist me
further

Hi, Some
things are
unclear:
how did you
try to log
on? on the
DC?
then it
would be
logical,
because
there a

Re: User login between domains in the same tree/frrest

"normal"
user does
not have the
logon
locally
right. (oh
and by the
way a
domain
admin in
one domain
will
be a
normal user
in another
domain, so)
Can you
please
explain the
setup you
used to
check this,
AFAIK it
is
possible to
log on to
the parent
domain
when
located on a
machine
in
the
child
domain. the
user does
have to
choose from
the
dropdown
list
his
OWN
domain...(or
use his user
principal
name)

good luck

Eric

Hi,

My
organisation
currently
has
one
domain
and
several
sites.

We
are
based
in
australia
and
have
a
new
remote
server
in
singapore,
we
are
considering
making
this
a
child
domain
of
our
current
domain,
but
are
unsure
if
we
should

Re: User login between domains in the same tree/frrest

make
it
a
child
domain
or
just
a
DC
of
our
current
domain
with
a
site
link?

if
we
make
it
a
child
domain,
and
we
have
users
in
singapore
on
this
child
domain,
can
those
users
then
come
to
our
parent
(forrest/tree
root)
domain
and
login
with
their
user

Re: User login between domains in the same tree/frrest

accounts
created
in
this
singapore
child
domain,
and
vice
versa?

I
thought
this
was
possible
but
i
recreated
this
situation
in
a
dev
environment,
creating
a
user
in
the
parent
domain,
but
that
user
was
unable
to
login
to
the
child
domain!

any
advice?

thanks
