In article <E8329AB2-A42E-4501-AD0F-DCD2F5058E54@xxxxxxxxxxxxxxxx>, ASessa@xxxxxxxxxxxxxxxxxxxxxxxxxxxx says...

I have a child domain in a DMZ and I'm trying to log into a machine on that domain with creds from another child domain and it's failing. The RPC ports are open between domain controllers but not between the machine in question to any other DC other than it's own. any thoughts? please let me know if you need more info.

Why have a firewall if you open ports (ms ports) between your networks? You completely obliterate network security when you open gaping holes between protected networks.
