Hello,

It may comes from the scope of the groups. They can be "universal" "domain local" "global".

You will understand the hierarchy of group, and which can be member of which here:

<http://technet2.microsoft.com/windowsserver/en/library/79d93e46-ecab-4165-8001-7adc3c9f804e1033.mspx?mfr=t>

Gurus,

I have one single domain. I have one group of users (General) in a security group who have access to certain files and folder. I've created another group (Elevated) whose users have access to the same as General, but also to some restricted files and folders.

I thought that I could take those users who need restricted access, out of General and into Elevated, and just add Elevated to the General group. In this way I would ensure that I am managing my file and folder permissions by Group, and not User.

However, when I go the properties of Elevated --> Member Of--> Add, I cannot get General to show up there.

Am I doing something wrong?

Thanks in advance for your time,

-Michael
