Jorge,

Yes it is..I posted twice about the same issue. I will try the steps you outlined in the last post to me and let you know what happens....

Thanks a lot!!

Paul

okay here is my setup.....

I have a test env. with forest a.com and 2 domains within, b.a.com and c.a.com.(all win2003)

I have pulled this setup from a different network and want to configure it on a different network.

I have three ad sites and all the ou's and gpo's are setup. I am not worried about names conflicting as this will be on an isolated network but would like to keep all the ad stuff intact.

I tried to change the ip setup on all these servers and restarted dns and the netlogon service. i did a dnsflush and dns register and i am still not able to have dns work correctly. all the dcs(6 in all, are dns servers and there are 2 servers per site)....i am getting alot of kdc errors and frs errors as well as nslookup doesn't come back with the right server. my

Re: Creating a new AD

question besides what am i missing is, do i need to change the ns in dns
on
all machines, and should i get rid of all old ips in dns and replace with
new
ones...also i created new ad sites with the new ip addresses and assigned
servers to those sites and deleted the old ones.. i rebooted one of the
a.com
servers and now i can't even log in...i guess my question is when changing
over to a new network with an exsiting ad and dns, how can i achive no
pain
in doing this?

Hi
Are you moving from lab to Production or from Production
to LAb?
