Hi

you might want to check the forceguest setting in registry

<http://technet2.microsoft.com/windowsserver/en/library/1d709278-ee2a-...>

Also enabling "Audit Logon events" for success and failure in the local security policy of the WinXP should give you more info in the security event log.

I've been frustrated by 2 machines now where installing an ADAM master instance has failed. Here are the details:

OS: XP Pro SP2
Workgroup Mode
Installing with local admin creds

Here are the steps:

1. I install the ADAM SP1 software
2. I create a new instance:

Re: Can't install ADAM master on XP SP2

- a. give it an instance name
- b. choose my ports (LDAP and SSL)
- c. Select NETWORK SERVICE as the service account
 - Here I am warned that remote connections may not be able to authenticate. This is fine with me since this is a stand-alone box
- d. Tell it that the currently logged on user (mybox\myadmin) should be an ADAM admin
- e. I give it a new partition to create (DC=MYPARTITION,DC=LOCAL)
- f. The instance installs successfully (or so it seems)

Then I try to connect with ADAM ADSI-EDIT as the logged-in user I get:

"The login attempt failed"

I then try to bind with LDP.EXE and I get an error that ldap_bind_s() failed. "Invalid Credentials". I get the same error if I try "bind with credentials" and give it the creds of my admin user.

Any thoughts on why I can't bind to a newly created ADAM instance locally, even when the instance install says it was successful?

The kicker is that I tried this on another XP pro machine 2 weeks ago and it went smoothly. This has failed twice for me today however on two different machines.

This is strange. I set forceguest to 0 and I turned logon failure auditing on and I get the errors I've pasted below (bottom of post). The fact that the process name is a bunch of garbled characters is a bit troubling. Is there a potential that a recent Windows update is incompatible with ADAM? The logon failure subcodes are nowhere to be found when doing Google searches – and I mean nowhere (Web, Groups, Froogle, Blogs, etc)

Re: Can't install ADAM master on XP SP2

Reason: An error occurred during logon

User Name: identix

Domain: SRTEST07

Logon Type: 3

Logon Process: 8 'Ôú°

Authentication Package: NTLM

Workstation Name: SRTEST07

Status code: 0xC000006D

Substatus code: 0xB0FC50
