Actually I miss spoke

Global Groups Cannot be added to Local Groups

Local Groups CAN be added to Global Groups

Assuming the domain is not in Windows 2000 Mixed Mode:

Global groups can:

1. Have users accounts and global groups (in the same domain) as members.
2. Be members of Universal and domain local groups in any domain, and global groups in the same domain.

Domain Local groups can:

1. Have users, global groups, and universal groups from any domain as members, and domain local groups from the same domain.
2. Be members of domain local groups in the same domain.

Universal Groups can:

1. Have users, global groups, and universal groups from any domain as members.
2. Be members of domain local and universal groups in any domain.

If you are in Windows 2000 Mixed Mode the only group nesting allowed is:
Global groups can be members of domain local groups.
