Hi

run dcdiag and nediag on the DCs, also make sure that the clients are pointing to the correct DNS server and that you don't have connectivity problems to the File servers that re hosting the profiles.

I hope that the information above helps you.
Have a Nice day.

Had a Windows 2000 AD domain with 2000 pro clients using roaming profiles. Insalled a few XP machines and they are taking up to four minutes to logon to the network using roaming profiles. Installed a new 2003R2 server and moved FSMO roles. Still kept the 2000 server as a domain controller with the 2003 server. I can logon with no wait at all on the XP machines if not logging in as a roamin profile user. Only when logging in with credential of roaming user does the XP logon times take so long. DNS is pointing to the new server first and the profiles are kept on the new servers. What could be taking the XP pcs so long to long in compared to the quick 2000 pro logons?
