Darren,

If you need to rely on the inheritance for some folders but would like to restrict for others, your best option is to use an explicit deny on the sub folders. You may find that you have to break the inheritance if the group is explicitly defined upstream, but you really don't have much of a choice.

You may also consider creating a new security group for these users and denying privileges downstream for this group. The group membership on the explicit deny will override the permit that is inherited.

Hello Darren,

Which groups has what rights on the top folder level?

Best regards

Meinolf Weber

Hi All

Audit dept has requested, I remove a particular group access from a number of sub folders but this group will need to retain access at the higher (root )level .

I was wondering what would be the best way to do this.. Should I deny access or remove the group ? Removing the group can get trick in my opinion since I would have to uncheck inherit . As far as I know, it's worse to mess around with turning off inheriting

Any feedback would certainly be appreciated.

TIA
