why not just using ldap to validate the account ?

As you are using .Net, you can even use integrated authentication, which is far better from a user experience perspective !

Thanks for your response, but by programming, only by programming, I need to know how to get the encrypted user password in Active Directory and then save it into a database.

By this way, when an user log on into my application, I'll try to encrypt the password manually introduced and I'll compare it with the other one saved into the database.

Regards.

Hello,

tools exist. They dump the AD database from DC.

What are you trying to achieve ?
