Hi,

I would like to know if some courses exist to explain every different architecture system topology ?

Indeed, many times I can figure out that I want to increase the security in different situations but I dont find any information on Microsoft website.

So I am not directly asking a technical question but I would like to find some documentations that explain every different topology that we can think about (for example when do I have to use a DMZ, if I have a domain authentication needed in this DMZ I can use ADAM, ADFS etc...)

I am searching for a while this kind of informations but with no success.

Thanks a lot for your help
