No you have R2 on this box so you need to extend the schema to match R2.  
This is only available on disk 2 of the R2 disk.

Try that and see if things work better for you.

I have a 2003 Active Directory domain. I need to add a new DC at a new remote site. I have windows 2003 Standard installed at the main site and I have window 2003 RC2 Enterprise for the remote location. I tried to run Make this an Active Directory wizard and it failed with and error saying that I need to run adprep. After some research it appears that I need to have the exact same OS at the remote site as I do at the local site? Is that true? If not, can some one to me a step by step proceedure or give me a KB with these instructions.

Thanks,
