Hello BrianMultiLanguage,

Your first post stated:

A users laptop is not part of the domain ???

Best regards

add the computer and the account should work.

OK. Looks like it already is but I'll delete it and readd it.

Thanks.

I'll post back.

Hello BrianMultiLanguage,

Even if the account in the domain and the local account on the computer are written the same, BUT there is no relationship between them. They have a different SID and will authenticate either on the domain via RDP which works, because of logging in to the domain server, not local on the computer or on the local computer and this account has no rights to the server shares. So add the computer to the domain and work with the domain user account.

Best regards

Meinolf Weber

A users laptop is not part of the domain but their login name and password on their laptop match their account name in AD. Since switching from sbs to server this weekend the user can not resolve the email server to their name, can not add network shares from servers, BUT can remote desktop to the same servers with thier domain\name password logon. I reset the password just in case but that did not fix it. I am stuck.
