Ok I have add, third time I might add, the laptop name to AD users and computers.

I will wait 90 minutes but I'll wager the result will be the same; no connections.

It's 1353 now so here we go.

I'll be back.

Thanks.

Here's so far.

Play by play.

1. sbs2003 network. Laptop not/never part of the domain.
2. user name/password on sbs domain match user/password on laptop.

will not work like i wrote you, because of the SID.

3. laptop in ou under SBS.
4. sbs server dead sunday night.
5. 2 new dc created, server03 std, monday. same domain name.

Re: sbs2003 to (new)server2003 user issue

Even if you use the same domain name, you have built a NEW domain with a NEW Domain SID, that the client doesn't know and is not part of.

6. laptop can not see the network shares on the dc's nor can it attach to exchange via outlook.

Because of the new domain SID.

7. laptop user has domain admin rights because he is. (this is always, never changed)
8. can not map drives with user or admin account/password.
9. can not add laptop to domain. ERROR access denied using rights from #8.
10. laptop user can see other servers in the domain AND if prompted for logon, domain\user and password works showing server, shares, etc.
11. laptop has never been on any domain just workgroup.
12. renamed the laptop. no change from above.
I am mentally fried from this work of disaster.
Thanks for any support.

You have built the domain totally new from scratch after the SBS was crashed. That means all user accounts, workstation names etc. are gone from the domain and the access rights are deleted. Even if you choose the same names (domain, server, workstation and users), it will NOT work, because the credentials on the workstation did not match the domain security.

The easiest way to get access to domain shares, exchange and all other will be, to add the workstation to the domain and work with user accounts created in Active Directory, via Active directory Users and computers.

Hello BrianMultiLanguage,

If you work over RDP to the SBS it will work on that way.
What do you mean with AD does not see it? If you add the workstation to the domain it will appear in AD in the user container, otherwise it is not added to the domain. How did you add it?

Best regards

Correct. Not part of the domain.

In the sbs versions, all I needed was to make sure my name and password account was on the domain.

No adding the pc in AD did not change, AD does not see it. Still can not attach to shares.

Hello BrianMultiLanguage,

Your first post stated:

A users laptop is not part of the domain ???

<http://www.dts-l.org/goodpost.htm>

add the
computer
and the
account
should
work.

OK. Looks
like it
already is

Re: sbs2003 to (new)server2003 user issue

but I'll
delete it and
readd it.
Thanks.
I'll post
back.

Hello
BrianMultiLanguage,

Even
if
the
account
in
the
domain
and
the
local
account
on
the
computer
are
written
the
same,
BUT
there
is
no
relationship
between
them.
The
have
a
different
SID
and
will
authenticate
either
on
the
domain
via

Re: sbs2003 to (new)server2003 user issue

RDP
which
works,
because
of
logging
in
to
the
domain
server,
not
local
on
the
computer
or
on
the
local
computer
and
this
account
has
no
rights
to
the
server
shares.
So
add
the
computer
to
the
domain
and
work
with
the
domain
user
account.

Best
regards

A
users
laptop
is
not
part
of
the
domain
but
their
login
name
and
password
on
their
laptop
match
their
account

Re: sbs2003 to (new)server2003 user issue

name
in
AD.
Since
switching
from
sbs
to
server
this
weekend
the
user
can
not
resolve
the
email
server
to
their
name,
can
not
add
network
shares
from
servers,
BUT
can
remote
desktop
to
the
same
servers
with
thier
domain\name
password
logon.
I
reset
the
password
just
in
case
but
that

Re: sbs2003 to (new)server2003 user issue
