Hello,
@Paul Bergson
@Zeno

First of all I would like to tank @Paul for his complete reply in this topic. I need to refresh it a little bit. On my network, there are two W2k3 R2 SP2 servers (DC1 and DC2) and both have the DC role. Active directory schema is simple. It is a single domain in forest, with only few not standard OU were the corporate clients and computers are dropped. There are no GPO?s attached to this OU?s.

By the way there are no extra GPO?s only the two standard GPO?s DDP and DDCP.

What is the problem:

I can?t access any share on DC1 by its computer NetBIOS name. If I go to: \\DC1\SYSVOL the access is Deny. The permissions and security config. For this folder are as it should be. This occurs when I?m logged in on an Administrator account locally on this DC. I can?t access any (even new created share) on this Server by using it?s NetBIOS name\share name. If you go to the share by the IP Address 192.168.10.1(ex.)\SYSVOL the access is granted.

I was checking the NetBIOS helper: OK (RUN) / NIC priority in advanced connection prosperities: OK (LAN NIC is the first one). The domain name pings are correct. The DC1 from DC2 pings are correct.

Can anybody help me with my problem !? I was looking for solution for about 4 months now and I cant find jack unfortunately. I am at the very thin line to go madness with this one. I even reconsider reformatting drives on this server and re-cofigurate it again. But is it the good idea ? I don?t think so.
