thanks for your responses guys. i'll let you know how it went.

i guess there is an exchange migration tool to remove their users mailboxes and exchange server to its' own site?

I agree. ADMT would be the way to go here.

Hi all, i'm hoping you can help me out here.

Re: Moving servers to a new domain – don't know where to start

We have a Windows 2003 domain with 5 domain controllers, and 2 backend Exchange 2003 servers. One of the Exchange backend servers is one of the 5 domain controllers.

The subdomain.domain.com format has been used since I started working here, but this serves 2 companies. The other company has been sold off and it will be my job to split the servers to an entirely new domain. So the Exchange Backend server will need to go along with 4 or 5 standard domain servers. Also their client machines will need to go as well.

Their servers are located at the datacentre alongside our servers and their client PCs are located at their office. We are at a separate office.

I am trying to think about how I am going to split their machines from ours to a new domain without affecting any of our systems. How would I do this?
I wouldn't know where to start.

Any help you can provide would be much appreciated.

Thanks

Andoni
