I have proven that I can just leave the machine and after 7 days the policy will apply, so far as I can work out this is down to the default kerberos policy 'Maximum lifetime for user ticket renewal' = 7 days after which time a new kerberos exchange occurs, the machine "logs on" and the PAC gets rebuilt with the additional group membership.

I dont want to wait and can't reboot so is there any way of forcing this process or should I raise a ticket with MS?

Re: Computer Account Group Membership

I don't know how waiting seven days is going to help as far as I know the machine has authenticated to the domain and until it re-authenticates (Reboot) I don't see how it can change its group membership token. The only way I am aware of is a reboot.

I am using computer account 'filter' groups to apply policy.

I add a computer account to the the group. I then have to reboot or wait 7 days (renewable kerberos tickets) for the membership and policy to apply.

How can I force this to happen without rebooting, I have tried variations of purging kerberos tickets and nltest and netdom to reset the secure channel or cycle the password but this doesnt seem to do it.

Rgds
